#### Citations and explanations

The problem addressed by the invention is that of providing an improved method for producing carotenoids that does not suffer from the technical disadvantages of previously known methods, as outlined in the introductory part of the description (see also EP-A-908 449 (document D1)), such as the difficulty of handling solid reaction partners.

The essential feature of the claimed method, which otherwise makes conventional use of Wittig or Wittig-Horner condensation, is the use of the dialkoxy dialdehyde of formula I (or Ia). This reactant can be advantageously used for carotenoid production via the intermediate product of formula IV (see claim 7), as indicated on page 8 of the description and illustrated in the examples.

The available prior art (document D1) contains no indications or suggestions that might have led in a simple and logical way to either the claimed method (claims 1 to 6) or the intermediate product of formula IV (claim 7).

The subject matter of the application therefore meets the requirements of PCT Article 33(2) to (4).
